TITLE : ANTI-DIM AGENT

ABSTRACT : PROBLEM TO BE SOLVED: To obtain an anti-dim agent consisting of an anionic surfactant and an organopolysiloxane containing a hydrophilic group, capable of being used very easily in general household and business uses, excellent in anti-dim property, and exhibiting an endurance for several days even in a bath room.

SOLUTION: This anti-dim agent consists of (A) an anionic surfactant (suitably, an 822C fatty acid soap, etc., such as sodium laurate) and an organopolysiloxane having a hydrophilic group. As the component (B), a polyoxyalkylene-modified organopolysiloxane having 40-70wt.% oxyethylene group content and 500-10,000 weight averaged molecular weight is preferable. The weight ratio of the components (A)/(B) is preferably set to (1/10) (10/1). Further, it is preferable to use as the objective anti-dim agent after blending solvents other than the components (A) and (B) to the agent for diluting. The degree of the dilution in its application is preferably to make the total of the components (A) and (B) as 5-20wt.% in the diluted solution.
